

# the RSConant Website Project

---

## Project overview

The RSConant Website Project is a website built by me to feature my UI/UX portfolio. It was the final project of my UI Design Course through the CareerFoundry online learning program. The specific course, called Front-end Development for Designers, is a series of fourteen steps, that instruct how to take the UI/UX design for my online portfolio and build it into a properly functioning website.

This project focused on my development as a front-end coder. I wrote the HTML, CSS, and JavaScript for the website, then performed testing to assure the final project met expectations.

I elected the Front-end Development for Designers course with two goals in mind; I wanted to expand my skillset into front-end coding, and this was a great way to start. My personal goal is to master UI design, UX design, and front-end development to increase my value in the workplace. I also wanted an understanding of the big picture. I was eager to learn how web development works on a deeper level, whether I was doing the coding or not. The perspective gained through this course would make it easier to collaborate with coders even if my role was limited to design only.
